SkyRoute Change Request CR-042

Title: Fuel policy update for dispatch planning

Status: Approved for implementation Owner: SkyRoute Ops (synthetic)

Date: 2026-10-30 Applies to: skyroute/fuel.py, skyroute/report.py

1. Background

Dispatch reviewed fuel planning after two diversions in the synthetic test fleet. The current plan has no alternate fuel and a contingency that can be very small on short legs.

2. Changes

2.1 The fuel plan shall include alternate fuel, computed as burn rate times alternate time. The default alternate time shall be 45 minutes.

2.2 Contingency fuel shall be the greater of 5 percent of trip fuel and 200 lb.

2.3 Total fuel shall be trip plus contingency plus alternate plus final reserve.

2.4 The plan report shall show total fuel rounded up to the next 10 lb.

3. Notes for implementers

Reserve should probably be raised for long flights, but dispatch has not agreed a number yet.

The CLI may later accept an --alternate-min option. Not in this change.

Existing requirement SR-FUEL-002 is replaced by item 2.2.

4. Example

Trip 1.0 h at 2400 lb/h: trip 2400 lb, contingency 200 lb (5 percent is 120 lb, below the 200 lb floor), alternate 1800 lb, reserve 1200 lb, total 5600 lb.

All content is synthetic training data. Not for operational use.
